

Guidance on using of the matrix

The matrix helps to describe new and on-going initial and further vocational training courses in the field of Building System Engineering (BSE) in a competence-based way providing a European focus. This systemic approach creates new quality requirements for the workers in the field of BSE.

The field of activity encompasses competences of the vocational fields of supply engineering, electrical engineering, information technology and structural engineering in initial vocational training as well as in further vocational training. Therefore, the units of the matrix are formulated in a very general manner and have to be referred to the vocational fields mentioned above. The definitions mentioned below (especially the definitions and examples of TGA) are used to identify the competences of the different vocational fields. To describe competences in the context of mobilities it makes sense to emphasize the connection to on-going initial vocational training courses.

The whole matrix refers to EQF-levels 3-6. The aspiration level of the matrix steadily increases vertically and horizontally. Therewith the degree of independence and responsibility increases, too.

Glossary (Definition of technical terms)

Building Systems	Building Systems encompass all technical components and processes of Building Systems during the stages of planning, constructing, operating and dismantling a building.
Processes of Building Systems	In accordance with Facility Management processes of Building Systems encompass all technical and service-related processes during the stages of planning, constructing, operating and dismantling a building (e.g. switch-on time of lighting, ventilating and air-conditioning systems, cycles of building cleaning, attendance time, energy flows, operating hours of monitoring systems).
Components of Building systems	Components of Building Systems encompass the particular technically relevant elements (building envelope and Technical Building Equipment [TBE]) during the stages of planning, constructing, operating and dismantling a building.
Building Envelope	The Building Envelope encompasses: - transparent components (glass facades, windows, doors, skylights), - optically-opaque (light-tide) components (stonework, roof, insulation, doors), - transitions between transparent and optically-opaque components (heat bridges: stonework<->windows)
Technical Building Equipment	TBE encompasses: - Installations and systems of heating technology including regenerative energies (e.g. condensing boiler, district heating, solarthermics, heat pumps, fuel cells) - Installations and systems of air-conditioning and ventilation technology including energy recuperation and regenerative energies (e.g. ventilating and air-conditioning systems, heat exchangers, heat recovery devices) - Installations and systems of sanitary technology including regenerative energies (e.g. drinking water storage tanks, solarthermics, heat pumps, drainage installations) - Installations and systems of electrical energy supply including energy recuperation and regenerative energies (e.g. PV systems, fuel cells, combined heat and power, power distribution systems, uninterruptible power supply, switchgears, measuring devices, compensation systems) - Installations and systems of lighting technology and emergency lighting (e.g. general lamps/illuminants, escape signs, ballasts, light control systems, dimmers, motion detectors, daylight sensors, lighting management systems [DALI]) - Installations and systems of building automation (e.g. sensors [feeler, motion detectors], actuators (shutters, valves), bus systems, access control systems, interior lighting, controlling heat and air-conditioning systems) - Installations and systems of information and communication technology (PBX-systems, intercom systems, Ethernet-based network technology, installations and systems of safety systems and emergency energy supply). - Installations and systems of safety technology and emergency power supply (alarm systems, access control systems, fire extinguishing systems, UPS-systems)

He/She is able to plan and realize processes of building systems and their components in terms of facility management. He/She is able to edit the technical characteristics, to calculate costs of operation and management of buildings, to specify service tasks and to compile corresponding statistics. He is able to use appropriate control, planning and management software.		ganise the documentation of all relevant data for facility operations and to edit management data of buildings.		He/She is able to prepare tender documents on the basis of legal requirements and user profiles. He/She is able to make deployment and work plans and to define personnel resources. He/She is able to compile optimising potential for existing and new systems and to deploy personnel for its realization. He/She is able to document the overall process and to advise customers regarding ways to enhance energy efficiency.
6	Identification, Realization and checking of legal requirements for the operation of building systems (operator responsibility)	He/She is able to identify the legal requirements for operating a building system on the basis of guidelines and regulations.	ting a building sys- ment legal requirements for operating pare documents to			independently pre- to check legal require-	ment (risk teamwork He/She is during the tion of bu	able draw-up a risk analysis), if necess able to consider the organisation of the ilding systems and deployment scheoo	sary in ne results ne opera- during	He/She is able to prepare /optimise a guideline (possibly in teamwork) for the realisation of legal requirements on the basis of work experience and to draw conclusions for future planning processes.
7	Monitoring costs and controlling	He/She can calculate basic data to monitor costs (for the planning, construction, operation and dismantling) of building systems and their components considering specifications or requirements.	He/She is able to analyse basic data to monitor costs and calculate key figures. He/She is able to analyse key figures to monitor costs (for the planning, construction, operation and dismantling) of building systems and their components.			ning, construction, operation and dismantling) of building systems and their components within a benchmarking system to identify optimising potential. He/Sh (plann)			tential a persona He/She (plannir	is able to realise calculated optimising po- and to prepare an appropriate work and al planning. is able to document the overall process ng costs, constructions costs, personnel perating costs, demolishing costs).
8	Marketing	He/She is able to identify customer needs and observe market trends.	He/She is able to conduct subject-oriented conversations on the basis of user profiles or market trends focussed on customer's aims. He/She is able to initiate/recommend measures to improve customer satisfaction.				•	e to analyse and ar Is and communicat ner.	•	He is able to assess his/her own market position and develop concepts and strategies safeguarding his/her future.
9	Personal manage- ment	He/She is able to define criteria for a suitable selection of personnel, possibly considering job descriptions, and to plan personnel requirements. He/She is able to identify training requirements and select and organise need-oriented training. He/She is able to conduct and document appraisal interviews. He/She is able to prepare personnel appraisals on the basis of defined criteria. He/She is able to identify individual and occupational development potentials of personnel and to promote it with the help of suitable measures.
