

## Guidance on using of the matrix

The matrix helps to describe new and on-going initial and further vocational training courses in the field of Building System Engineering (BSE) in a competence-based way providing a European focus. This systemic approach creates new quality requirements for the workers in the field of BSE.

The field of activity encompasses competences of the vocational fields of supply engineering, electrical engineering, information technology and structural engineering in initial vocational training as well as in further vocational training. Therefore, the units of the matrix are formulated in a very general manner and have to be referred to the vocational fields mentioned above. The definitions mentioned below (especially the definitions and examples of TGA) are used to identify the competences of the different vocational fields. To describe competences in the context of mobilities it makes sense to emphasize the connection to on-going initial vocational training courses.

The whole matrix refers to EQF-levels 3-6. The aspiration level of the matrix steadily increases vertically and horizontally. Therewith the degree of independence and responsibility increases, too.

## Glossary (Definition of technical terms)

Building Systems	Building Systems encompass all technical components and processes of Building Systems during the stages of planning, constructing, operating and dismantling a building.
Processes of Building Systems	In accordance with Facility Management processes of Building Systems encompass all technical and service-related processes during the stages of planning, constructing, operating and dismantling a building (e.g. switch-on time of lighting, ventilating and air-conditioning systems, cycles of building cleaning, attendance time, energy flows, operating hours of monitoring systems).
Components of Building systems	Components of Building Systems encompass the particular technically relevant elements (building envelope and Technical Building Equipment [TGA]) during the stages of planning, constructing, operating and dismantling a building.
Building Envelope	The Building Envelope encompasses: - transparent components (glass facades, windows, doors, skylights), - optically-opaque (light-tide) components (stonework, roof, insulation, doors), - transitions between transparent and optically-opaque components (heat bridges: stonework<->windows)
Technical Building Equipment	TBE encompasses:  - Installations and systems of heating technology including regenerative energies (e.g. condensing boiler, district heating, solarthermics, heat pumps, fuel cells)  - Installations and systems of air-conditioning and ventilation technology including energy recuperation and regenerative energies (e.g. ventilating and air-conditioning systems, heat exchangers, heat recovery devices)  - Installations and systems of sanitary technology including regenerative energies (e.g. drinking water storage tanks, solarthermics, heat pumps, drainage installations)  - Installations and systems of electrical energy supply including energy recuperation and regenerative energies (e.g. PV systems, fuel cells, combined heat and power, power distribution systems, uninterruptible power supply, switchgears, measuring devices, compensation systems)  - Installations and systems of lighting technology and emergency lighting (e.g. general lamps/illuminants, escape signs, ballasts, light control systems, dimmers, motion detectors, daylight sensors, lighting management systems [DALI])  - Installations and systems of building automation (e.g. sensors [feeler, motion detectors], actuators (shutters, valves), bus systems, access control systems, interior lighting, controlling heat and air-conditioning systems)  - Installations and systems of information and communication technology (PBX-systems, intercom systems, Ethernet-based network technology, installations and systems of safety systems and emergency energy supply).  - Installations and systems of safety technology and emergency power supply (alarm systems, access control systems, fire extinguishing systems, UPS-systems)
